# SEMI-GOLIATH CRANE PORTAL CRANES

The **STREET SEMI-GOLIATH CRANES** are the perfect solution to efficient lifting and handling in industry. This is just part of Red Rooster Lifting's full range of Street equipment available.

Street semi-goliath cranes also known as semi-portal or semi-gantry cranes are a variation on the goliath crane concept and run on one floor rail and one high level rail mounted on columns or a building structure.

Semi-goliath cranes are suitable for the applications described above for full goliath cranes but they bring unique advantages in certain applications. In particular they bring specific benefits where they are specified to run beneath overhead cranes in production facilities to give localised hook service to production cells down one side of a bay and the overhead crane provides general hook service of the whole bay. They may also operate under a gantry crane cantilever as shown in the adjacent application picture.

Street Crane has 75 years of experience designing and manufacturing Portal, goliath and semi-goliath cranes and is considered a leader in the field.

## SEMI-GOLIATH CRANE RANGES AND OPTIONS:

- Single girder capacities 0 – 25 tonnes
- Double girder capacities 0 – 200 tonnes
- Spans up 50 meters
- Options:
  - Cantilevers
  - Pendant, remote or cab control
  - Out of service wind speed anemometers
  - Supply by powered or non-powered cable reeling drums.
  - Storm anchors
  - Anti collision systems.
  - Supply by conductor bars or festoon systems at the non-leg end.
